Alert  
The safety and efficacy of levetiracetam therapy in neonatal seizures has not been evaluated by randomised controlled trials. Consult a paediatric neurologist for further advice on dose recommendations.

Indication  
Treatment of neonatal seizures.

Action  
The exact mechanism of action of levetiracetam is unclear. Levetiracetam appears to act by modulation of synaptic neurotransmitter release (GABA, glutamic acid) through binding to the synaptic vesicle glycoprotein 2A and by effects on calcium entry and release pathways in the brain.

Drug Type  
Anticonvulsant

Trade Name  
Hospira Levetiracetam, Keppra IV, Levetiracetam IV APOTEX, Levetiracetam Juno, Levetiracetam Sandoz  
Keppra Oral, Kerron Oral, Levetiracetam-AFT Oral

Presentation  
500 mg/5 mL vial  
100 mg/mL oral solution

Dosage / Interval  
Acute onset seizures refractory to first-line therapy (e.g. hypoxic ischaemic encephalopathy)

Add-on therapy for recurrent seizures
IV or PO – 10 mg/kg/dose every 12 hours day 0-7 of life and 8-12 hourly from day 8 of life (maximum dose 60 mg/kg/day)

Route  
IV and Oral

Preparation/Dilution  
IV  
Draw up 3 mL (300 mg) and add 17 mL of sodium chloride 0.9% or glucose 5% to make a final volume of 20 mL with a concentration of 15 mg/mL. Infuse dose over 15 minutes.

Oral  
Give undiluted. If volume is too small, take 1 mL (100 mg) and add 9 mL of water for injection to make a final volume of 10 mL with a concentration of 10 mg/mL.

Administration  
IV infusion: Infuse over 15 minutes.

Oral: May be given with or without feed (although feed delays the absorption of levetiracetam - this is not a problem if the infant is on maintenance doses). May be given at the same time as other medications.

Monitoring  
The goal is to achieve clinical control of seizures. Monitor side effects clinically (see adverse reactions). There is a paucity of evidence on target serum concentrations in neonates. Therapeutic concentrations are not routinely measured but may be useful to optimise dose and interval. Target trough concentration > 20 mg/L when seizure frequency is high and 10–40 mg/L subsequently titrated to seizure control. [1, 2, 16] Trough concentration may be useful to determine dosing adjustments in renal impairment. Consult paediatric neurologist for further advice.

Contraindications  
Hypersensitivity to levetiracetam or any of the ingredients.

Precautions  
Do not stop levetiracetam therapy abruptly in infants on prolonged therapy (refer to special comments section). Use with caution in renal impairment.
Although similar dosing has been used in premature infants, there are minimal pharmacokinetic data in this population.

### Drug Interactions
Clearance may be increased by 30% with co-administration of phenobarbital (phenobarbitone), carbamazepine and phenytoin.

### Adverse Reactions
Adverse reactions are very rare. Sedation and irritability have been reported in neonates. In children, commonly reported problems include behavioural problems and somnolence, loss of appetite, vomiting, dizziness, rash and insomnia. These are more common with polytherapy. [3] Other rare adverse effects that have been reported in older children and adults (but not observed in neonates so far): thrombocytopenia, leukopenia, neutropenia, toxic epidermal necrolysis, Stevens-Johnson syndrome, erythema multiforme, hepatitis, hepatic failure, weight loss, pancreatitis.

### Compatibility
Fluids: Glucose 5% (10% not tested), sodium chloride 0.9%.
Y-site: No information available.

### Incompatibility
Fluids: No information available.
Y-site: Amino acid and lipid solutions.

### Stability
Diluted solution: Stable for 24 hours at 2–8°C or 6 hours at 25°C. Vials are single use only.
For oral solution: Once opened, discard after 7 months.

### Storage
Store below 25°C.

### Special comments
In children, oral bioavailability is 100% and no dose adjustment necessary when changing from IV to oral or vice versa. If therapy is to be stopped, levetiracetam should be withdrawn slowly in consultation with a paediatric neurologist. A general weaning regimen is 20–25% reduction per week over 4–5 weeks.[4]

### Evidence summary
**Treatment of seizures in term infants:** Several case series have reported typical 70–80% response rates to levetiracetam when used either first line or for seizures refractory to other anti-epileptic drugs. Loading doses ranged from 10–50 mg/kg/day and maintenance dose 10 mg/kg/day titrated to a maximum of 80 mg/kg/day.[1, 5-9] (LOE IV)

**Treatment of seizures in preterm infants:** Case series have reported typical 80% response rates to levetiracetam when used either first line or for seizures refractory to other anti-epileptic drugs. Loading doses ranged from 10–50 mg/kg/day and maintenance dose 10 mg/kg/day titrated to a maximum of 60 mg/kg/day.[9, 10] (LOE IV)

**Safety:** There is currently insufficient evidence on the safety of levetiracetam in neonates.[3] However, levetiracetam use in neonates appears to be safe and efficacious in case reports so far although randomised controlled trials are lacking.

**Pharmacokinetics:** Have not been reported in preterm infants.[1] The half-life in neonates is longer compared to older children.[1] Peak plasma concentrations are achieved at 1.4 hours after an oral dose. Median half-life was reported to be 18.5 ± 7.1 hours on day 1 and averaged approximately 9 hours (range 3–13 hours) when assessed day 7–30. Over the first week, the CL increases into the range of older children.[1] The CL is lower in neonates and infants with renal impairment requiring monitoring of trough concentrations and dose adjustment.[1, 2] In children, the clearance was reported to be increased by 30% with co-administration of phenobarbital (phenobarbitone), carbamazepine and phenytoin.[11] In children aged 2–46 months, oral administration is characterised by rapid absorption, resulting in peak plasma concentrations within 1.4 hours of dosing and a half-life 5 hours.[12] Recommendations are to target levetiracetam trough concentration > 20 mg/L when seizure frequency is high and — 10 - 40 mg/L subsequently titrated to seizure control.[1, 2, 16]
