

CODE: T8700 M9080/3

ID NOS: MB73354 A8270

DIAGNOSIS: OVARY – DERMOID CYST (BENIGN CYSTIC TERATOMA)

CLINICAL HISTORY: F/65. This lesion of the ovary was an incidental finding at autopsy. The patient died as a result of widespread malignant lymphoma.

MACROSCOPIC: The upper specimen shows a well formed tooth that had developed in an ovarian dermoid cyst. The lower specimen shows the typical contents of a dermoid cyst, consisting of greasy sebaceous material and hairs.

MICROSCOPIC: The cyst is lined by squamous epithelium with well-formed skin appendages, and there are hairs in the lumen (left image). The wall contains connective tissue including adipose tissue and a focus of bone (right image). No immature tissues are seen.
