

CODE: T6600 M8143

ID NOS: HX22386 131842

DIAGNOSIS: APPENDIX - ADENOCARCINOMA INFILTRATING BLADDER.

CLINICAL HISTORY: F/69. Cystoscopy and biopsy performed during investigation of urinary tract infection showed adenocarcinoma. At operation the bladder was removed with adherent appendix.

MACROSCOPIC: Specimen consists of portion of bladder and urethra with attached portion of appendix. There is a fungating tumour in the apex of the bladder. The lumen of the appendix attached to this area of the bladder also shows fungating tumour which is in direct continuity with that in the bladder creating a fistula between the two structures.

MICROSCOPIC: Sections show a mucinous adenocarcinoma. This is a primary adenocarcinoma of the appendix which has invaded through the full thickness of the bladder wall.
