

**CODE:** T7840 M8810/1

**ID NOS:** 2104 14260

**DIAGNOSIS:** FIBROMA OF TUNICA VAGINALIS.

**CLINICAL HISTORY:** M/69. A swelling at the upper pole of the testis had developed over a period of six weeks. Orchidectomy was performed.

**MACROSCOPIC:** There is a poorly demarcated pale neoplasm in the wall of tunica vaginalis just anterior to the head of the epididymis and above the body of the normal testis. A small hydrocoele is also present.

**MICROSCOPIC:** The tumour consists of intertwining elongated and stellate cells in a matrix of mature collagen (left image). Parts of the tumour has a looser myxoid background (right image). No mitotic figures were seen.
