

CODE: TX111 M9530

ID NOS: HB77829 A14575

DIAGNOSIS: CRANIAL MENINGIOMA

CLINICAL HISTORY: F/77. There was nothing in the clinical history to suggest this lesion. Death resulted from cardiac failure, the cause of which was not conclusively demonstrated.

MACROSCOPIC: A round encapsulated tumour is attached to the inner aspect of the dura mater in the left parietal region. At autopsy it was found to be lying in a corresponding concavity in the underlying hemisphere, from which it was readily removed.

MICROSCOPIC: The tumour consists of whorls of cells in a pattern strongly suggestive of normal arachnoid granulations.
