

**CODE:** T2800 M9170/1

**ID NOS:** NX140626 10833

**DIAGNOSIS:** LUNG - LYMPHANGIOMA

**CLINICAL HISTORY:** M/30. No history is available except that a 'cyst' was removed from the right lung. It arose from the upper surface of the lower lobe and projected into the interlobar fissure.

**MACROSCOPIC:** This unidentifiable irregular piece of tissue is a multi-loculated cystic structure.

**MICROSCOPIC:** A number of slit-like spaces interconnect and are partly lined by flattened endothelium. Some fibrin clot is present in the lumen, whilst collections of lymphocytes can be seen in the walls.
