

CODE: T0100 M8830/4

ID NOS: Barratt & Smith 93839

DIAGNOSIS: UNDIFFERENTIATED PLEOMORPHIC SARCOMA
(MALIGNANT FIBROUS HISTIOCYTOMA).

CLINICAL HISTORY: M/58. This lesion was removed from the back following recurrence after a previous attempt at ablation.

MACROSCOPIC: An ovoid tumour is present in the subcutis and appears to invade the underlying muscle. Irregularity of the overlying skin probably results from the previous surgical procedure.

MICROSCOPIC: The sections show a malignant pleomorphic sarcoma. Interwoven fascicles of spindle cells are interspersed with bizarre multinucleated giant cells.
