

**CODE:** T0300 M9170/2

**ID NOS:** NX147597 10734

**DIAGNOSIS:** LYMPHANGIOMA (CYSTIC HYGROMA) OF SCROTUM

**CLINICAL HISTORY:** M/30. A slowly growing soft a subcutaneous lesion was surgically removed from the scrotum. It had been present for about eight years.

**MACROSCOPIC:** This rather ragged pearly lesion has been bisected to show many thin walled cystic spaces. Flecks of incorporated yellow subcutaneous fat can be identified on the right.

**MICROSCOPIC:** There are multiple cystic spaces lined by flattened endothelium, and in some places fascicles of smooth muscle are incorporated into the intervening fibrous trabeculae.
